

Training course for fire protection helpers

The German compressed air regulation for hyperbaric work, the Labor Protection Law §10, the Accident prevention regulations DGUV regulation 1 §22 and ASR A2.2 Section 6.2 give rise to several obligations in the area of fire protection.

Consequently, all employees must be instructed in the fire protection regulations (exercises, practical fire extinguishing training) and at least 5% of the employees trained as fire protection helpers. There must always be a fire protection worker in the team of workers in hyperbaric work. For this purpose, we offer a basic course as a fire protection helper every 2nd Tuesday of the month.

Content of the course in accordance with DGUV 205-023 and ASR A2.2:

- Basic features of fire protection
- Organized company fire protection
- Danger from fires and correct behavior in case of fire
- Tasks and specifics during the evacuation (Control of escape and rescue routes)
- Theoretical and practical fire extinguisher training

Duration: 4 hours

Refresher: every 3-5 years (according to DGUV-I 205-023)

In case we undertake the training at your company, the number of participants is limited to 10 people. A room of at least 2,5m² per participant must be available for the theoretical instruction. The practical fire-fighting exercise will take place immediately afterwards. For this purpose, an area with a fireproof and walkable underground the size of two parking spaces must be available. All extinguishing agents for the practice extinguishers are included in the course price.

For further information and registration please contact Peter Späth via office@compressed-air-work.net.
